Money in. Already sorted.

Programmable income routing for Nigerian merchants, built on ALATPay.

Team ALATPay Streams · Build with ALATPay Buildathon 2026

The problem: every naira lands in one pool

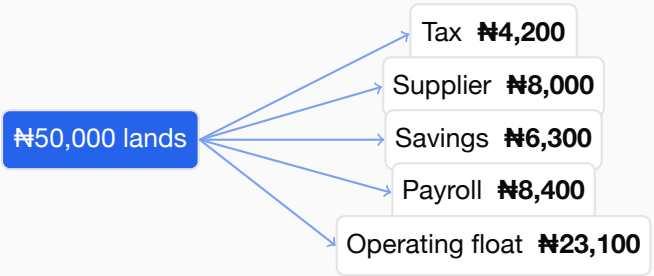

- A merchant's sales, tax money, supplier money and salary all sit in **one account balance** — and get spent as one.
- VAT is a quarterly ambush. Suppliers are paid late. Savings never happen.
- The discipline is manual: notebooks, mental math, three phones.

Nigeria has **40M+ MSMEs**. Cash-flow indiscipline — not demand — is what kills most of them.

The moment of failure

The money was there when it landed.
It was gone when the bill arrived.

The fix: split every payment at source

sums to the input, always

The merchant never has to remember. The rules remember.

How it works: one deterministic split engine

Income lands → rules split → ledgers fill → AI acts

1. **FIXED** ledgers settle first, in strict priority
2. **WEEKLY_FIXED** fires only on its configured day
3. **PERCENTAGE** ledgers share the remainder
4. Whatever is left → **operating float**

Why deterministic

One pure function decides where every kobo goes. No AI in the money path — the co-pilot *configures* rules, it never *moves* funds.

Live demo — two minutes

1. **Burst** — customer payments animate into ledgers (one arrives via Tap & Pay)
2. **Streams Voice** — *“I just sold 80k today, business has been good this week”*
3. **Loan offer** — the co-pilot answers with a pre-approved offer; we accept by voice
4. **Streams Uptime** — *“Your GTBank account — healthy, 99.1% uptime. Sending ₦400,000 now.”*

Everything on screen is running against the split engine and the ALATPay integration you’re about to see.

The merchant counterpart to ALAT: The Evolution

Pillar	Consumer (ALAT)	Merchant (Streams)
Voice	SAW voice banking	Streams Voice — configure ledgers, check sales, accept loans by speaking
Contactless	Tap and Pay	Tap & Pay routing — NFC payments split like any other channel
Predictive uptime	Recipient bank availability	Streams Uptime — rail health checked before every payout

Wema built all three for consumers. We built them for merchants.

Streams Loans: underwritten by streams, not paperwork

- Scorecard runs on **90 days of routed income** — real revenue, already on our rails
- Offer surfaced in chat or voice; accepted in one sentence
- Repayment is **just another ledger** — deducted at source from every sale, so no missed instalments

Credit policy documented in `underwriting/MODEL.md` — ask us about it.

₦2,400,000

pre-approved in the demo

6%

of daily income, deducted at source

Streams Uptime: we know a bank is down before your customer does

- Settlement rails scored continuously across Nigerian banks
- Checked **before** every loan disbursement and supplier payout
- Degraded rail? The transfer detours — no failed splits, no stranded funds

The demo line

“Approved. Your account at GTBank — healthy, 99.1% uptime today. Sending ₦400,000 now, expected to land in 4 seconds.”

Built on ALATPay — properly

Collection

- Official SDK contract (`apibox.alatpay.ng`)
- Virtual accounts · payment links · transaction status

Webhooks

- HMAC signature verification (prod + staging header variants)
- Redis dedupe — retries land exactly once

Resilience

- Idempotency keys on every payout
- Exponential backoff, 6s hard timeout
- Circuit breaker fails fast after 5 misses

Express 5 · TypeScript · Prisma/Postgres · Redis · Next.js dashboard

Nine endpoints. That's the whole API.

Why this wins for Wema

- **ALATPay transaction data** becomes programmable income routing — a reason for merchants to keep volume on ALATPay rails
- **Defensible underwriting** on routed income opens SME credit with repayment at source
- **WhatsApp + voice co-pilot** reaches merchants who never open a laptop
- Wema distribution × ALATPay rails × Streams intelligence

Sticky deposits, richer data, credit-ready merchants — on infrastructure Wema already owns.

Every naira knows where it’s going.
